Overview

The key FC SAN physical components are network adapters, cables, and interconnecting devices., power supplies, and fan modules are all hot-swappable. It describes the key components of an FC SAN including 11 FibreVault (or five fibre. Fibre channel is the general name of an integrated set of standards being developed by the American National Standards Institute (ANSI). The fibre channel standard defines a high-speed data transfer interface that can be used to connect workstations, mainframes, supercomputers, storage. The intrinsically superior architecture of the Cisco® MDS 9700 Series of 32-Gbps Fibre Channel-capable Multilayer Data Switches is described and contrasted with implementations of older architectures to demonstrate the importance of mission-critical directors. The MDS 9700 Series directors are the. This chapter gives an overview the different components that exist for Fibre Channel. Fibre Channel is primarily used to connect computer data storage to servers in storage area networks (SAN) in commercial data centers.
