

Should the fiber optic transceiver be connected to the router's WAN port

Overview

Plug the SFP module into the router's SFP port for fibre optic connectivity. No additional settings need to be made. Only one type (RJ-45 or SFP) of connection can be used at a time with a combined WAN port. If the SFP module is installed, the RJ-45 connector will not. The SFP+ port is a high-speed optical-to-optical signal conversion port, mainly used for 10G Ethernet and Fiber Channel network applications. It offers several advantages, including hot-swappability, support for multiple transmission media and protocols, as well as flexibility and scalability. These types of ports can be used with various transceivers thereby allowing the system administrators to customize connectivity according to their network topology. An SFP (Small Form-factor Pluggable) transceiver is a compact, hot-swappable module that fits into a switch, router, or media converter. They come in various form factors such as SFP, SFP+, QSFP+, and XFP.
