

The optical module cannot be removed if it is inserted incorrectly

Overview

The solution is to unplug the fiber and reinsert it into the SFP module interface until a “click” sound is heard, indicating the fiber connector and SFP module are properly connected. Contamination or damage on the fiber end face requires the use of a fiber end-face inspection. To ensure device safety and facilitate routine maintenance, do not remove dust plugs from optical fiber ports before connecting them, and clearly mark TX/RX ports on all cables for easy identification and subsequent management. For more information on transceiver TX/ RX-ray power issues, see. Check the model of the faulty optical module. If it is not a Huawei-certified optical module, replace it with a Huawei-certified optical module. If the optical module is installed on a GE port, run the display interface GigabitEthernet x/x/x command to view port information when the optical module. For DS110DF111, it is followed by a 10G SFP optical module, but after repeated insertion and removal, the optical module cannot be used, and the link status is displayed down. Is this related to DS110DF111?

How can it be solved Thanks bin Hi Bin, I wouldn't expect repeated insertion/removal of the. Unplug the optical fibers from the optical module before removing it. If an optical module cannot be completely inserted into an optical. Based on typical issues encountered with optical modules in daily switch applications, this document summarizes basic troubleshooting steps for resolving common faults: 1. Check compatibility between the optical module and switch Most switch brands have specific compatibility requirements. Small Form-factor Pluggable modules (SFP module) are the workhorses of modern network connectivity, enabling flexible fiber optic or copper links between switches, routers, firewalls, and servers. Whether you're upgrading bandwidth, replacing a faulty unit, or reconfiguring your topology,...
